1 Class notes

1.1 Week 1

1. In your understanding, why do automated processes discriminate against certain groups, what factors specifically causes them to discriminate? Try to guess the factors.
 - it could be the model is not a equitable choice.
 - it could be the dataset — there's more training samples (existing data) of majority groups having jobs, so the model will perpetuate these trends
 - scaling up creating a cycle issue of bias
 - aggregate analyses can make it difficult to see specific instances of discrimination
2. Do you perceive any potential oversights or flaws in the authors' arguments? Is there anything that should be interrogated or explored in more depth?
 - leaves a considerable aspect unaddressed: does not consider applicants with Visas, who are automatically turned down.
 - could also expand into other aspects of discrimination like gender, class, other aspects of background.
 - what about the other vendors?
 - could introduce some controls to see if the results change?
 - may not be considering how multiple apps / person might create some bad fits for job apps.

Python challenge:

Write some python code that does something while containing the following components listed below.

- a loop

- a list
- a function

Solution:

```
import random

def greeting(names):
    greetings = [
        "how are you doing today?",
        "tudo bem?",
        "what's shakin'?",
        "oi!",
        "como te sientes?"
    ]
    for i in names:
        print(f"Hello {i}, {random.choice(greetings)}")

greeting(['Kirsten', 'Filipa', 'Tony', 'Clare'])
```

Output:

```
Hello Kirsten, como te sientes?
Hello Filipa, oi!
Hello Tony, what's shakin'?
Hello Clare, how are you doing today?
```
